

MenB

What is it?

MenB protects against meningitis caused by “meningococcal serotype B,” a kind of bacteria. Meningitis is an infection of the coverings of the brain and spinal cord.

What happens if my child does not get it?

If not vaccinated, adolescents are at higher risk of getting meningitis. Even when treated, meningitis frequently leads to serious consequences, including permanent disabilities and death.

When does my child get it?

2 doses of MenB are recommended to teens at 16-18 years old.
