

ROTAVIRUS

What is it?

Rotavirus is a very contagious virus that lives in poop and is transmitted through contaminated food, surfaces, and bodily fluids.

What happens if my child does not get it?

Unvaccinated children are at higher risk of rotavirus infections, which cause fever, vomiting, and diarrhea. Severe infections can cause dehydration and require hospitalization.

When does my child get it?

This vaccine is given as a drop in the mouth at 2, 4, and 6 months old.
